PREVENT

MECHANIC IN A BOTTLE

“In as little as 15 minutes MIB can start working revitalising poor running engines or even non-starting engines.”

PROBLEM

As fuel decays it can leave deposits in the engine; causing it to run poorly, or in some cases; not at all. If your engine has been run with stale fuel it can cause excess carbon deposits to build up in the cylinder and also blockages within the carburettor. Another one of the side effects of modern ethanol blended fuel is that it can also cause damage to essential rubber components such as fuel lines, grommets, diaphragms, etc. causing them to perish.

B3C SOLUTION

Suitable for both 2 and 4-Stroke engines, Mechanic In A Bottle removes the varnish that can build up within the fuel system without the need to remove the carburettor, breaking down carbon deposits and revitalising rubber components. With a poor running engine, just adding 8ml (2 Caps) per 1 Litre of fuel and running your engine for 15 minutes can start to repair damage caused by bad fuel. For non-running engines, simply prime neat Mechanic In A Bottle through the fuel system, then leave it to work its magic.
